- Slony-I
- Write load versus reliability
- Network Topology versus flexibility
- Only solves a subset of the problems
- Shared some internal implementation (as txid_snapshot)

- in-database PGQ modules (C coded triggers)
- Skytools python framework
- PGQ python librairies, utilities to code consumers (daemons)
- Specific consumers, such as londiste
- Extra tools based upon the framework, such as walmgr

What does that mean for me?

A flexible architecture allows

- Cross version and architecture replication
- Version and Schema upgrade support
- General asynchronous processing support
- Limited set of concepts

PGQ Nodes

PGQ architecture has changed so that the queue themselves can be replicated from a node to another, to allow for online switchover facilities. That comes with 3 node types:

- Root
- Branch
- Leaf

PGQ Nodes

Example (qadmin status)

```
bdd2$ londiste3 demo.ini status
Queue: demo Local node: bdd2
bdd1 (root)
                              Tables: 85/0/0
                              Lag: 3s, Tick: 8706
  +--bdd2 (branch)
                              Tables: 85/0/0
                              Lag: 3s, Tick: 8706
     +--web1 (leaf)
                              Tables: 85/0/0
                              Lag: 3s, Tick: 8706
```

Cooperative Consumers

PGQ is often used on its own, for general queuing needs that are not tied to replication. In some cases you want to have multiple consumers draining in parallel from the same queue, but *sharing* the work.

Includes failover. When a consumer stops consuming, its current batch gets reassigned to another one after a configurable timeout

qadmin

qadmin is the new interactive command line, replacing pgqadm and offering a much richer set of commands.

- connect, install
- create queue, alter queue, show ...
- register, unregister
- londiste commands

- Execute scripts (DDL support)
- londiste ... add -create
- Parallel COPY
- Column granularity
- Online topology changes
- Custom handlers (plugins)

debian Packaging

Completely new for skytools3

- skytools3
- python-pgq3
- python-skytools3
- skytools3-walmgr
- skytools3-ticker
- postgresql-8.4-pgq3
- postgresql-9.0-pgq3

- Best way, do it on a new target database
- Upgrade PGQ schema
- Upgrade modules
- Upgrade to pgqd

Upgrading Services

That's the easy part (thanks to compatiblity)

- Daemons: the API is compatible
- Mostly: no more failed queue
- Londiste should run fine

Any question?

Now is a pretty good time to ask!
